Zomato customer analysis

As a multinational restaurant aggregator and food delivery company, Zomato needed to analyze the business performance of restaurants and customers registered in the service.

This analysis covers two segmentations: Customer Analysis, and Sales Analysis

Zomato Data

To conduct this analysis, we have used the data collected from Zomato.

To better understand the results we specifically focused on three tables: users, orders, and restaurants.

What the data means and how it was used

To carry out the analysis we have used different ways of measuring data but the common factor was using the average count.

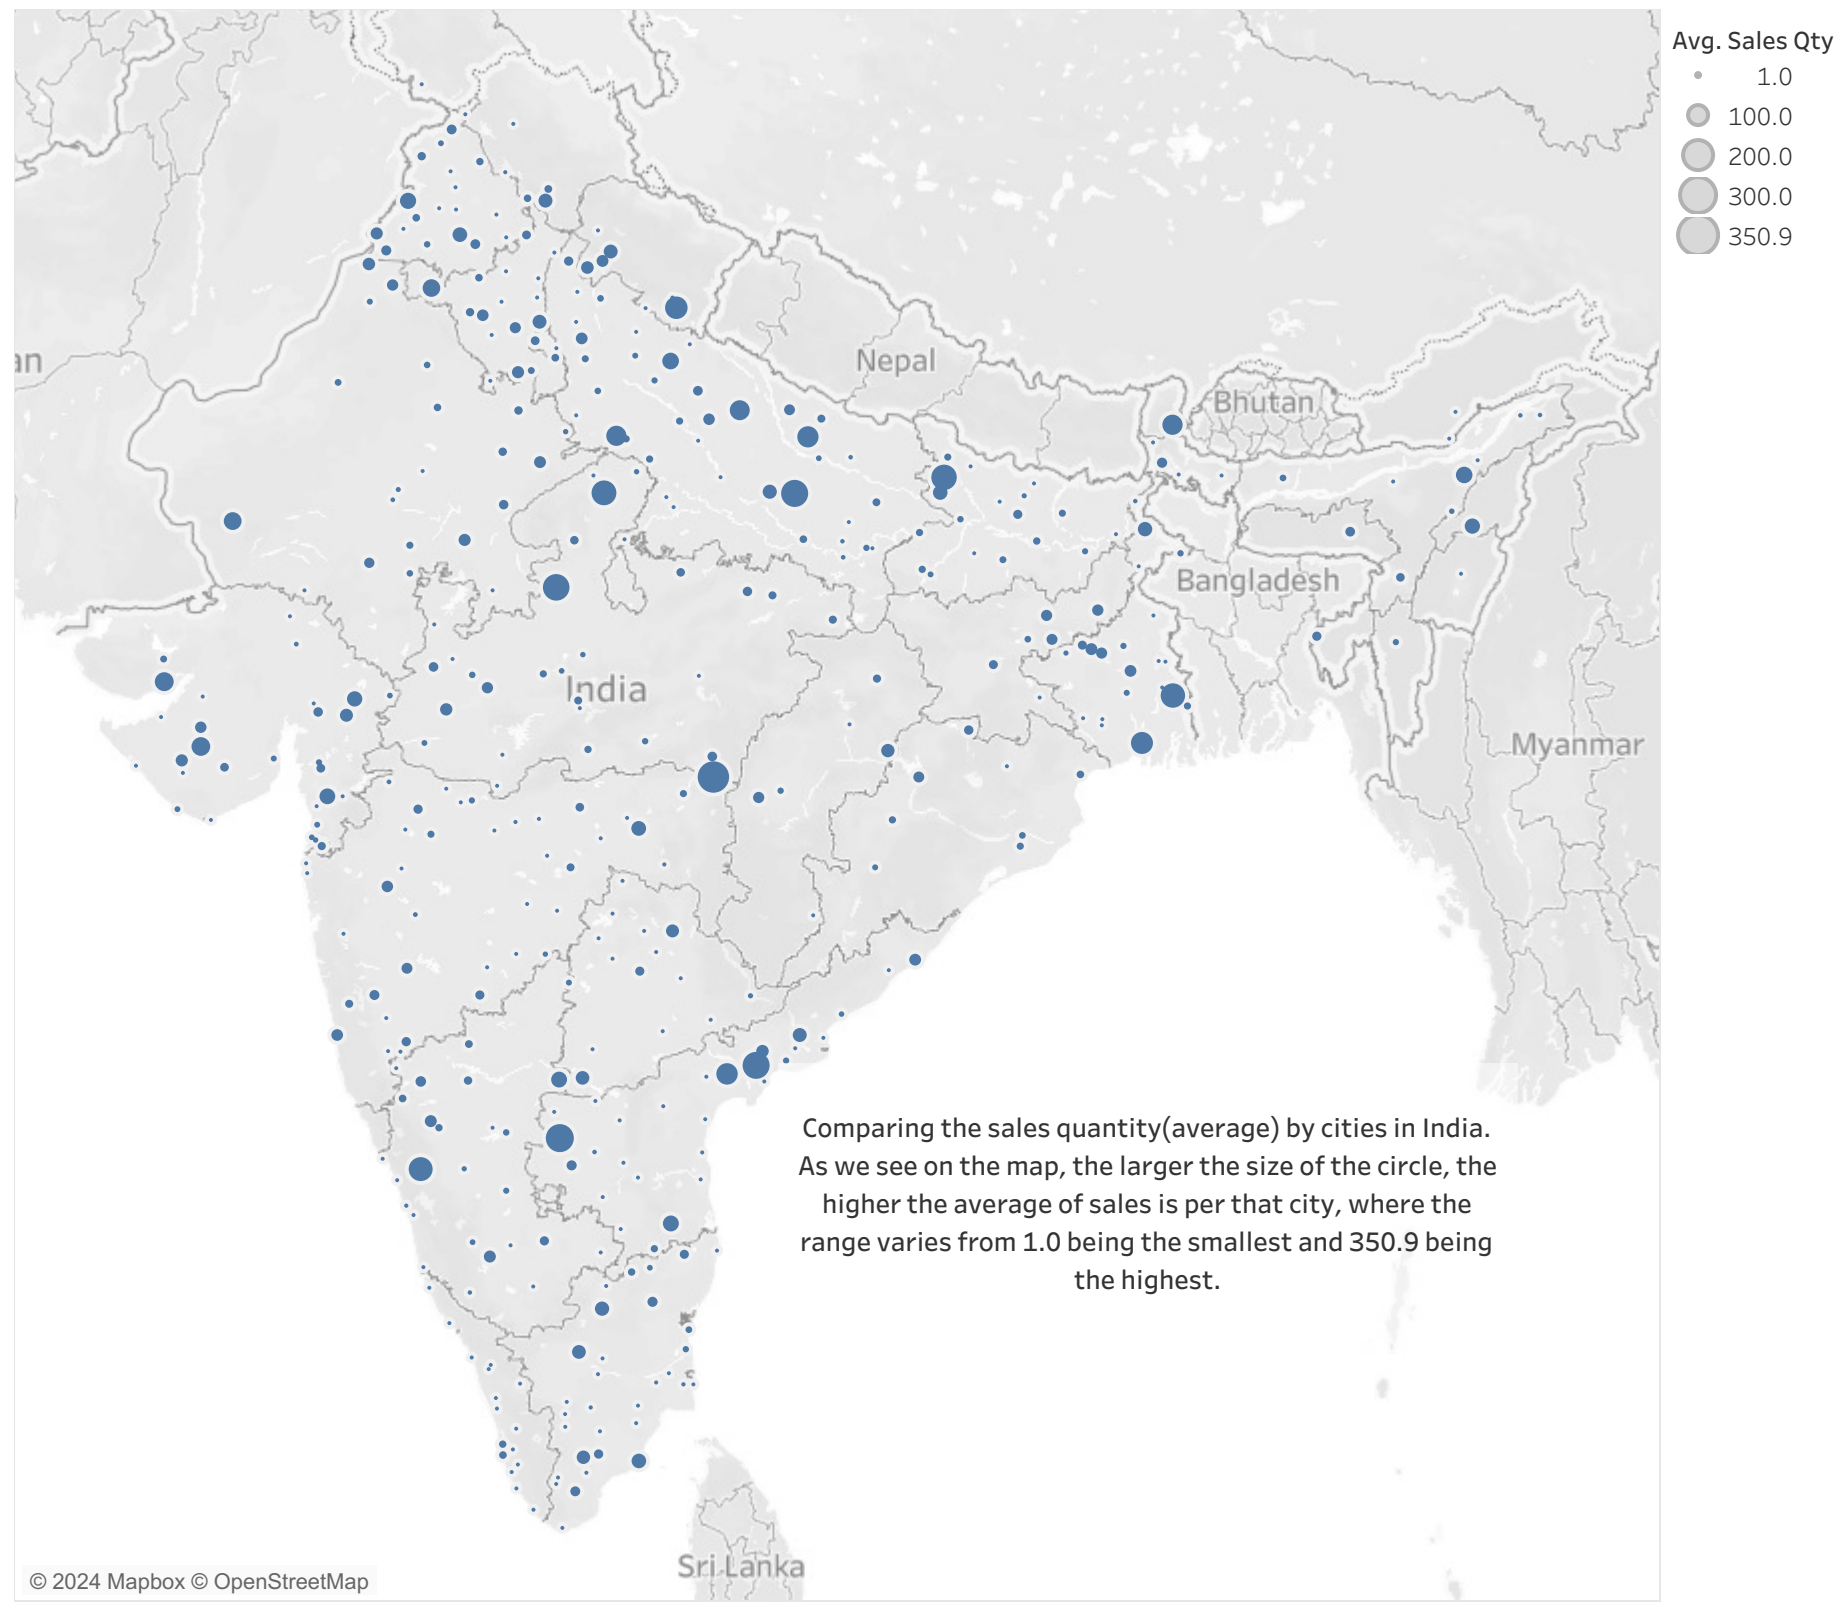

In the first visual, we compared the average sales quantity by cities in India to see what impact the population of each city has on sales.

In the slides to follow, we used the Average and especially the average of sales amount to understand sales by: City, time, occupation, family size, and age group.

In the last two visuals we took a look at the effect of Order volume over time, and order volume of unique users by using very similar measures to determine that there is indeed a trend.

Conclusion

Sales should be measured by average, as it paints a more clear and effective picture of business performance.

Due to size and Population orders and sales in India are at a higher volume than Bangladesh and Nepal.

August, March, and April are highest in Sale amount and quantity during the year.

Sweets,Tandoor and **Biryani, Bakery** have the highest sales amount between the Cuisine category, while Students and Employees have the highest sales between the occupations.

Cuisine prefernce also varies depending on family size, in example a family of 3 prefers orders from **Pan-asian, snacks** over others.

Although very similar in spending behavior, age groups **18-25** spend more in **August** then **November**, while age group **26-33** spend more in **March** then **August**.

There is a trend between **order volume over time**, and **order volume of unique users** where those in the Single marital status category tend to place a significantly higher volume of orders than those in the Married marital status category throughout the year ...

Recommendations

Focus on India especially during August, March and April.

Target marketing to other occupation categories like the **self-employed** and the **Housewife** to increase sales.

Offer a reward system, freebie, or a sign-up bonus to use Zomato to maintain and increase sales/performance all across the board.
